ZECPATH AI | Day 65

Enhancement Report - Final Enhancements and Feature Polish

Purpose

This report records the final code refinements and focused verification completed for Day 65. The work covers screening consistency, recruiter report clarity, and resilience in the Python candidate-ranking pipeline.

Completed Enhancements

1. Screening consistency

When plain, unstructured answer history does not support a reliable consistency check, the scorer now assigns a neutral 5/10 and explains that consistency could not be verified. This avoids treating missing structured history as evidence of inconsistency.

2. Screening report clarity

Screening reports present candidate and session context, question references, a score on a 0-100 scale, review flags, job-requirement status, communication signals, extracted skills, and a recruiter summary under clear labels. Sentiment and unparsed skill answers are not presented as verified qualifications.

3. Recruiter-facing recommendation report

The Markdown report labels unified score and decision confidence on a 0-100 scale. It clarifies that decision confidence is a heuristic indicator, not a probability of candidate success. Human-review status and decision reasons remain visible; the report does not recalculate the underlying recommendation.

4. Candidate-ranking resilience

The ranking CLI now calls the FairnessMasker method provided by the project. Skill extraction uses the shared resume schema adapter, accepts legacy list and categorized skill formats, handles missing skills as empty, and gives a readable skip message for unsupported skill data.

5. Human oversight

The updated outputs retain evidence, missing-data context, and review flags. Hiring recommendations remain decision-support signals for recruiter review.

Verification and Scope

Focused verification

- 16 report-generator and report-export tests passed, including the new score-scale and confidence-label check.
- 6 candidate-ranking compatibility and resume-data-pipeline tests passed using the repository virtual environment.
- Changed Python files compiled, and git diff whitespace checks passed.

Product UI and API scope

The repository contains Python scoring modules and command-line scripts. It does not currently contain a recruiter-facing application UI or HTTP API routes. The file under website/ is the company marketing website, not the product interface; no website change is included in this report.

Operational handoff notes

- Run the complete test suite in the project virtual environment before a release; the focused checks above cover the modules changed for this work.
- Review score evidence, missing data, and decision reasons together. A recruiter remains responsible for the final hiring decision.
- A product UI or HTTP API should be scoped as separate work if required; none was added during this feature-polish pass.
